CLAIM AMENDMENTS

1. (Currently amended) An encapsulation device for the repair of an articular cartilage defect, the device comprising:

a body having a generally annular frame supporting therein a solid shell-like metal cover portion for disposition adjacent a bone in an area of the cartilage defect;

an elongated leg structure comprising a plurality of elongated leg members, each extending from a distal side of said body for disposition in the bone in the area of the cartilage defect, said leg structure members each having a length which is a plurality of magnitudes greater than a thickness of said body, and being of a generally conical configuration;

said body annular frame comprising a peripheral frame portion, and an said cover portion being integral with said frame portion an integral cover portion and disposed within said frame portion and of a configuration bowed proximally to always provide a bowed proximal end profile for engagement by a complementary-shaped tool head, and adapted to maintain that profile during engagement of said body with the tool head; and

said leg structure comprising a plurality of elongated leg
members extending from a distal side of said frame portion;

each of said leg members being provided with a central channel therein, each of the channels opening on a proximal side of said frame member and extending to a point removed from proximate a closed distal end of said leg member;

wherein at least one of said leg members is provided at a distal end thereof with an end portion enlarged beyond a periphery of said leg member at a proximal end of the end portion and a generally crested end portion at a distal end of the end

portion.

2. (Canceled)

3. (Currently Amended) The device in accordance with claim 1 wherein each of said leg member end portions comprises \underline{a} circumferential protrusion thereon for gripping the bone.

4-8. (Canceled)

9. (Currently amended) The device in accordance with claim 1 wherein said peripheral frame portion bounds said cover portion.

10-15. (Canceled)

- 16. (Original) The encapsulation device in accordance with claim 1 wherein the device is of a selected one of (i) bioabsorbable material and (ii) bioremodelable material.
- 17. (Original) The encapsulation device in accordance with claim 1 wherein the device is impregnated with cell growth material.

18-19. (Canceled)

20. (Currently amended) A method for effecting a repair to an articular cartilage defect, the method comprising the steps of:

providing an encapsulation device comprising a body for disposition adjacent a bone in an area of the cartilage defect, and an elongated leg structure comprising a plurality of elongated leg members extending from the body for disposition in the bone in the area of the cartilage defect, the elongated leg structure comprising at least one leg legs each provided with a central channel therein, the channel being open on a proximal side of the frame member and being closed at the distal end thereof;

the body comprising a peripheral circular frame portion and a <u>shell-like metal</u> cover portion fixed within the frame portion and <u>of a configuration bound bowed</u> proximally therefrom to provide a bowed proximal surface, such that a central portion of the cover portion <u>always</u> extends proximally further than a peripheral portion of the cover portion—;

producing an elongated hole in the bone for each leg of the encapsulation device leg structure; and

driving each leg of the leg structure of the encapsulation device into the hole provided therefore in the bone to bring a distal surface of the <u>bowed</u> encapsulation device body into adjacency with the bone.
